
React SPA
same-origin /caliber/
identical in both topologies: pick one
A · EMBEDDED
B · STANDALONE
One MLflow server process
MLflow core AND the CALIBER ASGI app, mounted as mlflow.app
shared failure domain: one crash takes both surfaces down
CALIBER ASGI :5001
API, SPA, in-process loops
HTTP
MLflow :5000
traces, registry, evaluate
CALIBER metadata DB
CALIBER_DATABASE_URL owns its own tables and Alembic history
MLflow backend store
a separate logical database, so the two Alembic histories never compete
CALIBER storage service
local or s3 ONLY; MinIO is reached as S3-compatible
MLflow artifact root
the full MLflow backend set, INCLUDING GCS
Two different stores are both called "the artifact store."
Support on one is not support on the other: reading MLflow's GCS support as CALIBER storage support is a configuration error waiting to happen.
The API and the SPA are identical in both modes, so this is an operations decision, not a feature one.
