

React SPA
same-origin /caliber/

identical in both topologies: pick one

A · EMBEDDED

One MLflow server process

MLflow core AND the CALIBER ASGI
app, mounted as mlflow.app

shared failure domain: one crash
takes both surfaces down

CALIBER metadata DB

CALIBER_DATABASE_URL owns its own tables
and Alembic history

CALIBER storage service

local or s3 ONLY; MinIO is reached as
S3-compatible

B · STANDALONE

CALIBER ASGI :5001

API, SPA, in-process loops

↓ HTTP

MLflow :5000

traces, registry, evaluate

MLflow backend store

a separate logical database, so the two Alembic
histories never compete

MLflow artifact root

the full MLflow backend set, INCLUDING GCS

Two different stores are both called "the artifact store."

Support on one is not support on the other: reading MLflow's GCS support as CALIBER storage support is a
configuration error waiting to happen.

The API and the SPA are identical in both modes, so this is an operations decision, not a feature one.
